

REPOTTING A HOUSE PLANT.

- Check the roots of your houseplants regularly. When the root ball fills the pot it is time to repot into a larger container. Water your plant about an hour before repotting, as this will make it easier to remove the plant from its pot and reduce root damage.
- Remove your plant from its pot. Check the roots for damage and cut off any that look dead or diseased.
- Choose a clean flowerpot about 2" bigger than the one the plant was growing in. Fill the bottom of the new container with about 2" of Multi-Purpose compost with added John Innes. Place the plant in the centre of the container and fill all round the side of the pot with more compost, making sure that you push the compost down into the sides with your fingers, but still ensure there is air in the compost. Tap the sides of the container to aid settling the compost.
- Water the plant. Keep the plant in its normal environment until it has settled into its new pot or container and feed with a high nitrogen fertiliser to aid vigorous root growth. We recommend Vitafeed 301.
